<b>Approval</b>	German Federal Aviation Authority
<b>Application</b>	manufacturing of gliders, motor gliders and motor planes, boat and shipbuilding, sports equipment, model airplanes, moulds and tools
<b>Operational temperature</b>	-60 °C up to +50 °C (-76 °F up to 122 °F) without heat treatment -60 °C bis +80 °C (-76 °F up to 176 °F) after heat treatment
<b>Processing</b>	at temperatures between 10 °C and 50 °C ( 50 - 122 °F)
<b>Features</b>	low mixed viscosity pot life from approx. 45 min. to approx. 5 h good mechanic properties high heat resistance
<b>Storage</b>	shelf life of 24 months in originally sealed containers

### Characteristics

**Laminating resin MGS® L 160**

Laminating resin system approved by the German **Federal Aviation Authority**, with different pot lives for processing of glass, carbon and aramide fibres, featuring high static and dynamic loadability.

After heat treatment at 50-55 °C (122-131 °F), the system meets the standards for gliders and motor gliders (operational temperatures -60 °C (-76 °F) to +54°C (130 °F). In order to meet the standards for motor planes (operational temperatures -60 °C (-76 °F) to +72 °C (162 °F), heat treatment at 80 °C (176 °F) is necessary.

The range of pot lives is between approx. 45 min. and 4 - 5 h. After initial curing at room temperature, the components manufactured with hardener 160 are workable and demouldable.

Hardeners 163 and 260 S stay brittle after initial curing at room temperature. Before processing or demoulding it is necessary to postcure in the mould 1-2 hours at 40-50°C (104-122 °F).

You will receive high-gloss and non-tacky surfaces, even with unfavourable initial curing conditions, such as lower temperatures or high humidities.

The mixing viscosity is very low - for this reason these combinations are also applicable for injection and pultrusion. When laminating manually at vertical surfaces, the resin can spill out of the fabrics, especially when using wide-mesh fabrics. For such cases we would recommend the application of laminating resin L 160 T.

The laminating resin system does not contain any unreactive components. All raw materials and additives feature a very low vapour pressure, therefore the material can be processed under vacuum even at elevated temperatures.

In connection with these properties, we do not expect any problems concerning compatibility in case of combination with polyester gelcoats, diverse paints (e. g. on the basis of PUR etc.) However, comprehensive tests are indispensable.

Although our resin systems are very unlikely to crystallize at low temperatures, storage conditions of 15 - 30 °C (59-86 °F) and low humidity are recommended. After dispensing material, the containers must again be closed carefully, to avoid contamination or absorption of water. All amine hardeners show a chemical reaction when exposed to air, known as „blushing“. This reaction is visible as white carbamide crystals, which could make the materials unusable.

Crystallization is visible as a clouding or solidification of the contents of the container. If crystallisation of either component should be observed, it can be removed by warming up. Slow warming up to approx. 50 °C-60 °C (122 °F-140 °F) in a water bath or oven and stirring or shaking will clarify the contents of the container without any loss of quality. Use only completely transparent products. Before warming up, open containers slightly to permit equalization of pressure. Caution during warm-up! Do not warm up over an open flame! While stirring up use safety equipment (gloves, eyeglasses, gas mask).

The relevant industrial safety regulations for the handling of epoxy resins and hardeners and our instructions for safe processing are to be observed.

**Application**

Other prereacted hardeners can be supplied as well as mixtures of Hardeners 160 and 260 S. They are labeled with an A (e. g. Hardener 160 A) These hardeners are characterized by a higher viscosity and are therefore especially suited to the lamination of vertical surfaces.

The mixing ratio stated must be observed carefully. Adding more or less hardener will not result in a faster or slower cure, but in incomplete curing with limited performance, that can not be corrected in any way.

Resin and hardener must be mixed carefully. Mix until no clouding is visible in the mixing container. Special attention must be paid to the walls and bottom of the mixing container.

## Laminating resin MGS® L 160

[°F] [°C] Temperature

## Temperature development

### Sample preparation

100 g / 20 °C (68 °F)

Time [h]

The optimum processing temperature is in the range between 20 and 40 °C. Higher processing temperatures are possible, but will shorten pot life. An increase in temperature of 10 °C will halve the pot life. Water (for example very high humidity or contained in fabrics or fillers) causes an acceleration of the resin / hardener reaction. Different temperatures and humidities during processing have no significant effect on the mechanical properties of the cured product.
